

Listening to different points of view on topics allows me to weigh different kinds of evidence and helps me to formulate my own opinion.

My favourite classes deal with theories and show how they conflict with or support one another.

I like tying together information from several classes even when those classes are very different.

Several opposing theories can contribute to the solution of a problem.

I like thinking about why I believe something – it helps me to distinguish between what I really believe and what I have just accepted from other people.

No two people can ever really be said to feel the same way about the same thing, so one can't say one person's wrong and the other is right.

Open-ended assignments are frustrating because I never know if I'm right.

Good teachers are rarely critical of what you believe to be true.

You can never really say that what someone else thinks is wrong.

If my teacher doesn't have an answer to my questions, it is because the teacher is not well prepared.

It is frustrating when class discussions don't come to clear conclusions or the teacher's comments seem ambiguous.

Discussion classes don't make any sense to me. How am I supposed to say something correct if the teacher won't tell us the answers?

There are very few things that are sure in this world, so I rely on my own mind to decide what is right.

I like classes where I can express my own opinions without being evaluated for them.

Group discussions are a waste of time; I just want the teacher to tell me what's important to know.

I am more interested in asking good questions than coming up with answers.
